

# Habitats Song

I am an explorer of this beautiful Earth,  
From the jungle to the polar caps  
There are so many different homes for living things,  
And we call them habitats

A forest is made up of trees and animals  
Oxygen and water are the norm  
Temperate means it goes through different seasons  
And tropical means it's very wet and warm

A forest is a home for living things,  
And it's one of the habitats

Grasslands can have many titles  
Pampas, prairies, savannas, or steppes  
And just like forests, they can be  
Tropical or temperate

A grassland is a home for living things,  
And it's one of the habitats

Freshwater can be a marsh or river,  
A wetland, a swamp, or a lake  
And freshwater can be ideal  
For insects, for beavers and snakes

Freshwater is a home for living things,  
And it's one of the habitats

The poles include the arctic and antarctic  
Both are very dry and cold  
And animals need blubber or hibernation  
If they want to live around the poles

A polar biome is a home for living things,  
And it's one of the habitats

A desert's dry and doesn't have much water  
Some species live by storing it inside  
Some hide beneath the sand when it gets hotter  
And come out in the open when it's night

A desert is a home for living things,  
And it's one of the habitats

The ocean is vast, and it's all saltwater  
With jellyfish, whales, and sharks  
From the coral reef in the shallow parts  
To the deep, where it's always dark

The ocean is a home for living things,  
There are even more homes for living things  
So many different homes for living things  
And we call them habitats
