

# Levels of organization and 1D spatial scale

Level	Figure	Description	Example (with approximate length)
Galaxy		<p>Superclusters are components of the universe. 🌌</p> <p>Galaxy groups are components of galaxy clusters &amp; superclusters. 🌠</p> <p>Galaxies are components of galaxy groups. 🌌</p>	<p>Ex: Milky way galaxy (diameter (isophotal))</p> <p>≈ 823 exameters (Em)</p> <p>≈ 823 quintillion (10<sup>18</sup>) meters</p> <p>≈ 5.5 billion astronomical units (AU)</p> <p>≈ 87,400 light years</p>
Solar/ star system		<p>☀️ Star systems are components of galaxies.</p>	<p>Ex: Sun to nearest star, Proxima Centauri</p> <p>≈ 40 petameters (Pm)</p> <p>≈ 40 quadrillion (10<sup>15</sup>) meters</p> <p>Ex: Saturn to the Sun (orbital distance)</p> <p>≈ 1.4 terameters (Tm)</p> <p>≈ 1.4 trillion (10<sup>12</sup>) meters</p> <p>Ex: Earth to the Sun (orbital distance)</p> <p>≈ 150 gigameters (Gm)</p> <p>≈ 150 billion (10<sup>9</sup>) meters</p> <p>≈ 149,597,871 km</p> <p>= 1 Astronomical unit (AU)</p>
Biosphere, planet		<p>🌍 Planets are components of solar/star systems.</p>	<p>Ex: Earth (diameter at equator)</p> <p>≈ 13 megameters (Mm)</p> <p>≈ 13 million (10<sup>6</sup>) meters</p> <p>≈ 12,756 kilometers</p>
Biome		<p>Biomes are components of biospheres.</p>	<p>Ex: Cryosphere ⇒ ice sheets &amp; polar deserts</p> <p>≈ kilometer → megameter scale</p>
Bioregion		<p>Bioregions are components of biomes.</p>	<p>Ex: Everglades National Park, FL (width)</p> <p>≈ 80 kilometers (km)</p> <p>≈ 80 thousand (10<sup>3</sup>) meters</p>
Ecosystem		<p>🌿 Ecosystems are components of bioregions.</p>	<p>Ex: Muir Woods, Marin, CA (width)</p> <p>≈ 1.5 kilometers (km)</p> <p>≈ 1.5 thousand (10<sup>3</sup>) meters</p> <p>Ecosystems are in the meter → km scale</p>
Organism		<p>Populations are components of ecosystems.</p> <p>🌱 Organisms are components of populations.</p>	<p>Ex: Human adult (height)</p> <p>≈ 1.5 → 2 meters (m)</p> <p>≈ 1.5 → 2 × 10<sup>0</sup> meters</p>
Organ		<p>🧠 Organs are components of organisms.</p> <p>🥑</p>	<p>Ex: Human brain (length)</p> <p>≈ 150 millimeters (mm)</p> <p>≈ 150 thousandths (10<sup>-3</sup>) of a meter</p>
Cell		<p>Tissues are components of organs.</p> <p>🧫 Cells are components of tissues.</p>	<p>Ex: Human red blood cell (diameter)</p> <p>≈ 7 micrometers (μm)</p> <p>≈ 7 millionths (10<sup>-6</sup>) of a meter</p> <p>🌐 Micrometer scale particles</p>
Molecule (DNA)		<p>🧬 DNA molecules are components of cells.</p> <p>The DNA (deoxyribonucleic acid) molecule determines every inherited physical characteristic of every living thing.</p>	<p>Ex: DNA double helix (diameter)</p> <p>≈ 2 nanometers (nm)</p> <p>≈ 2 billionths (10<sup>-9</sup>) of a meter</p>
Molecule (Protein)		<p>Protein molecules are components of cells.</p> <p>Proteins are large molecules made (in cells) of long amino acid chains.</p>	<p>Ex: Fibroin (diameter)</p> <p>≈ 2 nanometers (nm)</p> <p>≈ 2 billionths (10<sup>-9</sup>) of a meter</p> <p>Fibroin is a protein made of 3 amino acids:</p> <ul style="list-style-type: none"> <li>• Alanine (Ala)</li> <li>• Glycine (Gly)</li> <li>• Serine (Ser)</li> </ul>
Molecule (Amino acid)		<p>Amino acid molecules are components of protein molecules.</p> <p>Our bodies use 20 different amino acids to make proteins. Nine of these we can not make, and must get them from food. They are called 'essential amino acids'.</p>	<p>Ex: Glycine C<sub>2</sub>H<sub>5</sub>NO<sub>2</sub> (length)</p> <p>≈ 390 picometers (pm)</p> <p>≈ 390 trillionths (10<sup>-12</sup>) of a meter</p>
Molecule (H <sub>2</sub> O)		<p>💧 Water molecules are components of cells, ecosystems, &amp; the biosphere.</p>	<p>Ex: H<sub>2</sub>O, water molecule (diameter)</p> <p>≈ 282 picometers (pm)</p> <p>≈ 282 trillionths (10<sup>-12</sup>) of a meter</p>
Atom		<p>⚛️ Atoms are components of molecules.</p> <p>Oxygen, atomic number 8, has:</p> <ul style="list-style-type: none"> <li>• 8 protons</li> <li>• 8 neutrons</li> <li>• 8 electrons</li> </ul>	<p>Ex: Oxygen atom (diameter)</p> <p>≈ 120 picometers (pm)</p> <p>≈ 120 trillionths (10<sup>-12</sup>) of a meter</p>
Subatomic particle		<p>Subatomic particles are components of atoms.</p> <p>There are 3 types of subatomic particles in each atom:</p> <ul style="list-style-type: none"> <li>• Proton (positive charge)</li> <li>• Neutron (neutral charge)</li> <li>• Electron (negative charge)</li> </ul>	<p>Ex: Proton (diameter)</p> <p>≈ 1.6 femtometers (fm)</p> <p>≈ 1.6 quadrillionths (10<sup>-15</sup>) of a meter</p>

Notes	Powers of 10 and scientific notation
<ul style="list-style-type: none"> <li>• Component ⇒ Building block, part, element, and/or structure within a larger whole.</li> <li>• Click or right click figure or emoji (in pdf file) to open full version or infographic.</li> </ul>	<p>5326.6 = 5.3266 × 10<sup>3</sup></p> <ul style="list-style-type: none"> <li>• 10<sup>3</sup> = 1,000 (10 × 10 × 10) ⇒ 1 followed by 3 zeros</li> <li>• 10<sup>6</sup> = 1,000,000 (one million) ⇒ 1 followed by 6 zeros</li> <li>• 10<sup>-3</sup> = <math>\frac{1}{1,000}</math> (one thousandth)</li> <li>• 10<sup>-6</sup> = <math>\frac{1}{1,000,000}</math> (one millionth)</li> </ul>
